

Census Mapping Template

The mapping process has traditionally been an extensive manual process prone to large human error. Creating each map manually or digitally on an individual basis takes time and a template significantly speeds up this process. This Enumeration District mapping template is the one of the latest versions of the numerous existing mapping template styles that have been used throughout history. It shares common components, yet it is fundamentally different from the versions used normally. Many different world and country map templates exist, particularly within GIS software rather than a strict focus on the ED map. This document also is accompanied by a unique best practices approach focused on an applied GIS programming approach used by some CARICOM countries.
